

## What is?

The 'Permanent Observatory of ICT in Healthcare' (ObservaTICS) is the result of the need to count on tools which allow us to know what is happening, in a sphere characterised by speedy evolution, volatility and obsolescence.

## Objectives

If we can depend on tools which facilitate continual analysis, development and influence of ICT in all spheres of human healthcare, this will allow us to investigate unexplored territory, make better conclusions, take better decisions, appreciate the inherent changes and as a result, progress. ObservaTICS uses the internet and collaborative tools on behalf of Spanish healthcare centres.

## For who?

Through its web portal ([www.observatics.com](http://www.observatics.com)) it offers information on the use by each hospital of the main social networks, the evolution of said use, the geolocalisation of each hospital and the healthcare resources at its disposal, etc.

ObservaTICS also uses a blog which aims to generate debate on the current situation of 'Hospitals 2.0' in Spain, to publicise and champion the effort of the most pioneering centres, demonstrating the possibilities of these tools and offering examples of their use, and inviting users to participate in ObservaTICS and integrate the project in their daily work methodology.

## ITACA-TSB in OBSERVATICS

ITACA-TSB is in charge entirely of the web development of this tool.
