

**WHAT**

Communication system to allow the creation of a wireless Body Area Network (BAN) and its communication to the exterior.

**HOW**

Based on IEEE 802.15.4/Zigbee wireless technology, the acquired by the sensors data will be forwarded by a little communication module (developed by the University of Malt) to the central element of the network. This central element will be allow the processing of the received from the sensors and will forward again through a GPRS or Wi-Fi network.

**WHO**

Non intrusive 24 hours monitorization applications development that allows the use of this system to the final users without any kind of disturb on his/her current life.
